DM19 – Algorithms and Complexity – E05 – Lecture 2

Lecture, September 7

We began with an introduction to the course. Probability from Appendix C, sections C.2, C.3, and C.4 were covered. The slides used to present this are available on the course's Web page. Randomized Quicksort, from sections 7.3 to 7.4 in the textbook, were presented. Randomized Quicksort is also presented in the course notes, those by Motwani and Raghavan. We began on RadixSort.

Lecture, September 14

Radix sort and counting sort from sections 8.2 and 8.3 in the textbook will be presented. Then lower bounds from section 2.4 of the first part of the notes will be discussed (part of this is also in section 8.1 of the textbook). If there is time, we will also begin on sections 3.1 and 3.2 of those notes.

Lecture, September 21

We will cover section 3.3 and 3.5 of the first set of notes, plus median finding from chapter 9 (sections 9.2 and 9.3) in the textbook.

Problems to be discussed in week 38

1. Do the following problems from the textbook: 8.1-1, 8.1-3 (just do the first part), 8.2-2. 8.2-4.

2. Do problems 3.2 (use Stirling's approximation - formula 3.17 from the textbook, and compare your result to the upper bound for merging, rather than to the lower bound mentioned) and 3.10 from page 140 and 141 of the notes.

3. From the following pages of that book by Baase:

   > Consider the problem of determining if a bit string of length n contains two consecutive zeros. The basic operation is to examine a position in the string to see if it is a 0 or a 1. For each $n = 2, 3, 4, 5$ either give an adversary strategy to force any algorithm to examine every bit, or give and algorithm that solves the problem by examining fewer than n bits.

and

a. You are given n keys and an integer k such that $1 \leq k \leq n$. Give an efficient algorithm to find *any one* of the k smallest keys. (For example, if $k = 3$, the algorithm may provide the first-, second- or third-smallest key. It need not know the exact rank of the key it outputs.) How many key comparisons does your algorithm do? (Hint: Don't look for something complicated. One insight gives a short, simple algorithm.)
b. Give a lower bound, as a function of n and k, on the number of comparisons needed to solve this problems.
