

# DM508 – Algorithms and Complexity – 2011

## Lecture 3

### Lecture, February 1

We finished sections 3.1, 3.2 and 3.3 of the DM508 notes, plus median finding from chapter 9 (section 9.3) in the textbook.

### Lecture, February 7

We will cover the lower bound on median finding from section 3.5 from the first part of the notes. We will begin on NP-completeness, from chapter 34 in the textbook and the section by Papadimitriou and Steiglitz from the course notes.

### Lecture, February 10

We will continue with NP-Completeness, covering Cook's Theorem.

### Problems to be discussed on February 16

Do problems:

1. 34.2-5, 34.2-8, 34.2-10.
2. 34.3-2, 34.3-6.
3. The following argument is incorrect. Find the most important error.

Consider the following algorithm:

```
Input:  $n \in \mathbb{N}$ 
for  $i = 2$  to  $n - 1$  do
    check if  $i$  divides  $n$ 
    if it does then output  $i$ 
endfor
output -1 if no output yet
```

Checking if  $i$  divides  $n$  can be done in time  $O(\log n)$  via binary search for an integer  $k$  such that  $n = i \cdot k$ .

Thus, the total running time is  $O(n \cdot \log n)$  in the worst case. Since  $O(n \cdot \log n) \subset O(n^2)$ , and  $n^2$  is a polynomial, this algorithm runs in polynomial time. Thus, we have an efficient algorithm for factoring,  $O(n \cdot \log n)$ , so we can break RSA, a famous cryptosystem which is believed to be secure.
