Finding repairs

Algorithm

- **①** Choose a set \mathcal{U} of update actions (based on \mathcal{I})
- 2 Compute $\mathcal{I} \circ \mathcal{U}$
- **③** Check if all AICs in η hold

Finding repairs

Algorithm

- Choose a set \mathcal{U} of update actions (based on \mathcal{I})
- 2 Compute $\mathcal{I} \circ \mathcal{U}$
- $\textcircled{O} Check \text{ if all AICs in } \eta \text{ hold}$

Each step can be done in polynomial time on \mathcal{I} and η .

Finding repairs

Algorithm

- Choose a set \mathcal{U} of update actions (based on \mathcal{I})
- 2 Compute $\mathcal{I} \circ \mathcal{U}$
- $\textcircled{O} Check \text{ if all AICs in } \eta \text{ hold}$

Each step can be done in polynomial time on \mathcal{I} and η .

Finding weak repairs is NP-complete.

Integrity constraints

Declarative semantics

The notion of repair ignores the head of the AIC.

Declarative semantics

The notion of repair ignores the head of the AIC.

Caroprese et al., 2006/2011

• founded repairs take into account the actions in the head

Declarative semantics

The notion of repair ignores the head of the AIC.

Caroprese et al., 2006/2011

- founded repairs take into account the actions in the head
- justified repairs avoid justification circles

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Founded repairs (I)

Intuitively: if ${\cal U}$ is founded, then removing an action from ${\cal U}$ causes some AIC with that action in the head to be violated.

Founded repairs (I)

Intuitively: if ${\cal U}$ is founded, then removing an action from ${\cal U}$ causes some AIC with that action in the head to be violated.

Definition

A set of update actions \mathcal{U} is founded w.r.t. \mathcal{I} and η if, for every $\alpha \in \mathcal{U}$, there is a rule $r \in \eta$ such that $\alpha \in \text{head}(r)$ and

 $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r.$

Founded repairs (I)

Intuitively: if ${\cal U}$ is founded, then removing an action from ${\cal U}$ causes some AIC with that action in the head to be violated.

Definition

A set of update actions \mathcal{U} is founded w.r.t. \mathcal{I} and η if, for every $\alpha \in \mathcal{U}$, there is a rule $r \in \eta$ such that $\alpha \in \text{head}(r)$ and

 $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r.$

(Equivalent to the original definition.)

Founded repairs (I)

Intuitively: if ${\cal U}$ is founded, then removing an action from ${\cal U}$ causes some AIC with that action in the head to be violated.

Definition

A set of update actions \mathcal{U} is founded w.r.t. \mathcal{I} and η if, for every $\alpha \in \mathcal{U}$, there is a rule $r \in \eta$ such that $\alpha \in \text{head}(r)$ and

 $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r.$

(Equivalent to the original definition.)

Definition

A (weak) repair that is founded is called a founded (weak) repair.

Founded repairs (II)

Example

Take $\mathcal{I} = \{a, b\}$ and

$$r_1:a$$
, not $b \supset -a$
 $r_2:$ not $a, b \supset -b$

 $r_3:a, \text{not } c \supset +c$

 $r_4:b$, not $c \supset +c$

Founded repairs (II)

Example

Take
$$\mathcal{I} = \{a, b\}$$
 and

$$r_1:a, \text{not } b \supset -a$$
 $r_3:a, \text{not } c \supset +c$ $r_2: \text{not } a, b \supset -b$ $r_4:b, \text{not } c \supset +c$

Then $\{+c\}$ is a founded repair,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Founded repairs (II)

Example

Take
$$\mathcal{I} = \{a, b\}$$
 and

$$r_1:a, \text{not } b \supset -a$$
 $r_3:a, \text{not } c \supset +c$ $r_2: \text{not } a, b \supset -b$ $r_4:b, \text{not } c \supset +c$

Then $\{+c\}$ is a founded repair, but so is $\{-a, -b\}$.

Founded repairs (II)

Example

Take
$$\mathcal{I} = \{a, b\}$$
 and

$$r_1:a, \text{not } b \supset -a$$
 $r_3:a, \text{not } c \supset +c$ $r_2: \text{not } a, b \supset -b$ $r_4:b, \text{not } c \supset +c$

Then $\{+c\}$ is a founded repair, but so is $\{-a, -b\}$.

In $\{-a, -b\}$ we have a *circularity of support*.

Founded repairs (II)

Example

Take
$$\mathcal{I} = \{a, b\}$$
 and

$$r_1:a, \operatorname{not} b \supset -a$$
 $r_3:a, \operatorname{not} c \supset +c$ $r_2:\operatorname{not} a, b \supset -b$ $r_4:b, \operatorname{not} c \supset +c$

Then $\{+c\}$ is a founded repair, but so is $\{-a, -b\}$.

In $\{-a, -b\}$ we have a *circularity of support*.

It is a founded repair that is not justified.

Justified repairs

The definition is meant to avoid circularity of support.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Justified repairs

The definition is meant to avoid circularity of support.

It is not intuitive and there is no motivation in the references.

Justified repairs

The definition is meant to avoid circularity of support.

It is not intuitive and there is no motivation in the references.

Too restrictive?

Take $\mathcal{I} = \{a, b\}$ and

 $r_1: a, b \supset -a$ $r_2: a, \text{not } b \supset -a$ $r_3: \text{not } a, b \supset -b$

Justified repairs

The definition is meant to avoid circularity of support.

It is not intuitive and there is no motivation in the references.

Too restrictive?

Take $\mathcal{I} = \{a, b\}$ and

 $r_1: a, b \supset -a$ $r_2: a, \text{not } b \supset -a$ $r_3: \text{not } a, b \supset -b$

Again $\{-a, -b\}$ is a founded repair that is not justified.

Independence vs. parallellization (I)

Theorem

Let $\eta = \eta_1 \cup \eta_2$ with $\eta_1 \perp \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and η . Define \mathcal{U}_i as the set of actions in \mathcal{U} affecting literals in the bodies of rules in η_i , for i = 1, 2. Then:

- each U_i is a weak repair for \mathcal{I} and η_i ;
- if \mathcal{U} is a repair, then so is each \mathcal{U}_i ;
- if \mathcal{U} is founded, then so is each \mathcal{U}_i ;
- if \mathcal{U} is justified, then so is each \mathcal{U}_i .

Furthermore, if every action in \mathcal{U} affects a literal in the body of a rule in η , then $\mathcal{U} = \mathcal{U}_1 \cup \mathcal{U}_2$.

Independence vs. parallellization (I)

Theorem

Let $\eta = \eta_1 \cup \eta_2$ with $\eta_1 \perp \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and η . Define \mathcal{U}_i as the set of actions in \mathcal{U} affecting literals in the bodies of rules in η_i , for i = 1, 2. Then:

- each U_i is a weak repair for \mathcal{I} and η_i ;
- if \mathcal{U} is a repair, then so is each \mathcal{U}_i ;
- if \mathcal{U} is founded, then so is each \mathcal{U}_i ;
- if \mathcal{U} is justified, then so is each \mathcal{U}_i .

Furthermore, if every action in \mathcal{U} affects a literal in the body of a rule in η , then $\mathcal{U} = \mathcal{U}_1 \cup \mathcal{U}_2$. This hypothesis is (very) reasonable in practice.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in \mathcal{U}_1$.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in U_1$. Since \mathcal{U} is founded, there is a rule $r \in \eta$ such that $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r$.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in U_1$. Since \mathcal{U} is founded, there is a rule $r \in \eta$ such that $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r$. Necessarily $r \in \eta_1$

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in \mathcal{U}_1$. Since \mathcal{U} is founded, there is a rule $r \in \eta$ such that $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r$. Necessarily $r \in \eta_1$ and $\mathcal{I} \circ (\mathcal{U}_1 \setminus \{\alpha\}) \not\models r$.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in \mathcal{U}_1$. Since \mathcal{U} is founded, there is a rule $r \in \eta$ such that $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r$. Necessarily $r \in \eta_1$ and $\mathcal{I} \circ (\mathcal{U}_1 \setminus \{\alpha\}) \not\models r$. Therefore \mathcal{U}_1 is founded.

Independence vs. parallellization (II)

Proof (sketch).

Given $r_1 \in \eta_1$ and $r_2 \in \eta_2$, changing the logical values of literals in the body of r_1 cannot affect the semantics of r_2 and vice-versa. This implies that U_i is a weak repair for \mathcal{I} and η_i .

This also implies that, if \mathcal{U} is minimal, then so must \mathcal{U}_1 and \mathcal{U}_2 be.

For foundedness, take $\alpha \in \mathcal{U}_1$. Since \mathcal{U} is founded, there is a rule $r \in \eta$ such that $\mathcal{I} \circ (\mathcal{U} \setminus \{\alpha\}) \not\models r$. Necessarily $r \in \eta_1$ and $\mathcal{I} \circ (\mathcal{U}_1 \setminus \{\alpha\}) \not\models r$. Therefore \mathcal{U}_1 is founded.

This means that we can parallellize the search for repairs without losing solutions.

Independence vs. parallellization (III)

Theorem

Let $\eta = \eta_1 \cup \eta_2$ with $\eta_1 \perp \eta_2$; \mathcal{I} be a database; and \mathcal{U}_i be weak repairs for \mathcal{I} and η_i , for i = 1, 2, such that all actions in \mathcal{U}_i affect a literal in the body of a rule in η_i .

Independence vs. parallellization (III)

Theorem

Let $\eta = \eta_1 \cup \eta_2$ with $\eta_1 \parallel \eta_2$; \mathcal{I} be a database; and \mathcal{U}_i be weak repairs for \mathcal{I} and η_i , for i = 1, 2, such that all actions in \mathcal{U}_i affect a literal in the body of a rule in η_i . Define $\mathcal{U} = \mathcal{U}_1 \cup \mathcal{U}_2$.

Independence vs. parallellization (III)

Theorem

Let $\eta = \eta_1 \cup \eta_2$ with $\eta_1 \parallel \eta_2$; \mathcal{I} be a database; and \mathcal{U}_i be weak repairs for \mathcal{I} and η_i , for i = 1, 2, such that all actions in \mathcal{U}_i affect a literal in the body of a rule in η_i . Define $\mathcal{U} = \mathcal{U}_1 \cup \mathcal{U}_2$. Then:

- \mathcal{U} is a weak repair for \mathcal{I} and η ;
- if each U_i is a repair, then so is U;
- if each U_i is founded, then so is U_i ;
- if each U_i is justified, then so is U.

Computing independent sets of AICs

The previous results generalize to several independent sets of AICs.

In order to split a set η into independent sets, consider the relation $\underline{\mathbb{A}}^+.$

Computing independent sets of AICs

The previous results generalize to several independent sets of AICs.

In order to split a set η into independent sets, consider the relation $\underline{\mathcal{M}}^+$. This is an equivalence relation.

Computing independent sets of AICs

The previous results generalize to several independent sets of AICs.

In order to split a set η into independent sets, consider the relation \underline{M}^+ . This is an equivalence relation. The quotient set η/\underline{M}^+ is the finest partition of η in independent sets, and can be computed efficiently.

(Similar to stratified negation in logic programming...)

Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$.
Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$. Assume that every action in \mathcal{U} occurs in the head of a rule in $\eta_1 \cup \eta_2$.

Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$. Assume that every action in \mathcal{U} occurs in the head of a rule in $\eta_1 \cup \eta_2$. Define \mathcal{U}_i as the set of actions in \mathcal{U} in the head of a rule in η_i , for i = 1, 2.

Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$. Assume that every action in \mathcal{U} occurs in the head of a rule in $\eta_1 \cup \eta_2$. Define \mathcal{U}_i as the set of actions in \mathcal{U} in the head of a rule in η_i , for i = 1, 2. Then:

Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$. Assume that every action in \mathcal{U} occurs in the head of a rule in $\eta_1 \cup \eta_2$. Define \mathcal{U}_i as the set of actions in \mathcal{U} in the head of a rule in η_i , for i = 1, 2.

Then:

 U₁ is a weak repair for I and η₁ and U₂ is a weak repair for *I* ◦ U₁ and η₂;

Precedence vs. stratification (I)

Theorem

Let $\eta_1, \eta_2 \in \eta/_{\approx}$ with $\eta_1 \prec \eta_2$; \mathcal{I} be a database; and \mathcal{U} be a weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$. Assume that every action in \mathcal{U} occurs in the head of a rule in $\eta_1 \cup \eta_2$. Define \mathcal{U}_i as the set of actions in \mathcal{U} in the head of a rule in η_i , for i = 1, 2.

Then:

- U_1 is a weak repair for I and η_1 and U_2 is a weak repair for $I \circ U_1$ and η_2 ;
- if \mathcal{U} is founded/justified, then so is each \mathcal{U}_i .

Conclusions

Precedence vs. stratification (II)

The proof is similar to the above.

Precedence vs. stratification (II)

The proof is similar to the above.

This allows us to sequentialize the search for repairs.

However, some results do not hold:

• it may happen that ${\mathcal U}$ is a repair, but ${\mathcal U}_1$ and/or ${\mathcal U}_2$ are not;

Precedence vs. stratification (II)

The proof is similar to the above.

This allows us to sequentialize the search for repairs.

However, some results do not hold:

- it may happen that ${\cal U}$ is a repair, but ${\cal U}_1$ and/or ${\cal U}_2$ are not;
- there may be a weak (founded, justified) repair U_1 for \mathcal{I} and η_1 that is not a subset of any weak repair for \mathcal{I} and $\eta_1 \cup \eta_2$.
