integrity constraints?

the goal what should the properties of a good formalism be?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

the goal what should the properties of a good formalism be?

- generalize existing notions in particular frameworks (e.g. relational databases)
- expressive enough to capture conditions spanning several systems

- decidability? good complexity bounds?
- algorithms for repairing inconsistencies

the goal what should the properties of a good formalism be?

- generalize existing notions in particular frameworks (e.g. relational databases)
- expressive enough to capture conditions spanning several systems
- decidability? good complexity bounds?
 - algorithms for repairing inconsistencies

our target

active integrity constraints (flesca et al., '04)

- defined for relational databases
- allow to express both *constraints* and *repair actions*
 - "good" algorithms for repair

relational dbs	the classical setting
deductive dbs	mostly mid-1980s → separate integrity constraints from data → integrity constraints as preferred models
ontologies	 last 15–20 years → open-world semantics makes the problem different → integrity constraints as terminological axioms (but with a different semantics)
heterogeneous systems	last 10 years → in multi-context systems (our setting) → internalize integrity constraints
in general	no continuation, no apparent consensus

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

our contribution

- integrity constraints in a general-purpose framework
- captures previous constructions as special cases
- clean separation between consistency and integrity

- express preferences between different models
- easily extended to include a notion of repair

conclusions

multi-context systems

main idea

- reasoning systems ("contexts")
- connected by datalog-style rules ("bridge rules")

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

the contexts

logic abstractly, a logic is characterized by:

- the set of its well-formed knowledge bases (syntax)
- the set of its possible belief sets (models)
 - a function assigning to each knowledge base a set of acceptable belief sets (semantics)

plus some technicalities regarding the use of variables (see paper)

the contexts

logic abstractly, a logic is characterized by:

- the set of its well-formed knowledge bases (syntax)
- the set of its possible belief sets (models)
 - a function assigning to each knowledge base a set of acceptable belief sets (semantics)

example first-order logic over a signature Σ

- knowledge bases are sets of well-formed formulas over Σ
- belief sets are pairs of first-order interpretations and assignments over $\boldsymbol{\Sigma}$
- the acceptable belief sets wrt a knowledge base are the models of that knowledge base

the contexts

logic abstractly, a logic is characterized by:

- the set of its well-formed knowledge bases (syntax)
- the set of its possible belief sets (models)
 - a function assigning to each knowledge base a set of acceptable belief sets (semantics)

context a context is defined as a tuple containing:

- its underlying logic
 - a particular knowledge base
 - a set of bridge rules (coming up) plus some technicalities regarding the use of variables (see paper)

bridge rules

definition

datalog-style rules to exchange information

$$(k:s) \leftarrow \bigwedge_{i=1}^{q} (c_i:p_i), \bigwedge_{j=q+1}^{m} \operatorname{not} (c_j:p_j)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

where k, c_i, c_j are context identifiers and s, p_i, p_j instantiate to elements of knowledge bases bridge rules

definition datalog-style rules to exchange information $(k:s) \leftarrow \bigwedge_{i=1}^{q} (c_i:p_i), \bigwedge_{j=q+1}^{m} \operatorname{not} (c_j:p_j)$ where k, c_i, c_i are context identifiers and s, p_i, p_i instantiate to elements of knowledge bases usual interpretation: if each p_i holds in context c_i , and semantics no p_i holds in context c_i , then add s to the knowledge base in context kusual safeness assumption \rightarrow

belief state

a belief state is a collection of belief sets (one for each context)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

belief statea belief state is a collection of belief sets (one for each
context)equilibriuman equilibrium is a belief set that is compatible with all
knowledge bases and bridge rules:
each S_i is an acceptable belief state wrt $(kb_i \cup app_i(S))$,
where $app_i(S)$ collects all heads of bridge rules in c_i
whose bodies hold in S

belief state a belief state is a collection of belief sets (one for each context) *equilibrium* an equilibrium is a belief set that is compatible with all knowledge bases and bridge rules: each S_i is an acceptable belief state wrt $(kb_i \cup app_i(S))$, where $app_i(S)$ collects all heads of bridge rules in c_i whose bodies hold in Sthink logic programming...

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

a belief state is a collection of belief sets (one for each belief state context) equilibrium an equilibrium is a belief set that is compatible with all knowledge bases and bridge rules: each S_i is an acceptable belief state wrt $(kb_i \cup app_i(S))$, where $app_i(S)$ collects all heads of bridge rules in c_i whose bodies hold in Sthink logic programming... $\sim \rightarrow$ an mcs is *inconsistent* if it does not have equilibria consistency several different types of equilibria exist (as in logic $\sim \rightarrow$ programming)

syntax an integrity constraint is written as a bridge rule with empty head

semantics an mcs *M* **strongly**/*weakly* satisfies an ic *r* if:

- M is consistent
- **all**/some of M's equilibria make the body of r false

syntax an integrity constraint is written as a bridge rule with empty head

good for theoretical results, bad for intuition

properties

- weak satisfaction of integrity constraints by an mcs reduces to logical consistency of an mcs
- strong satisfaction of integrity constraints by an mcs reduces to logical inconsistency of an mcs

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

properties

- weak satisfaction of integrity constraints by an mcs reduces to logical consistency of an mcs
- strong satisfaction of integrity constraints by an mcs reduces to logical inconsistency of an mcs
- decidability of satisfaction is equivalent to decidability of consistency

- weak satisfaction is usually as hard as context consistency
- if context complexity is in class Σ_i^P , then strong satisfaction is in class Δ_{i+1}^P

the future

conclusions

relational databases

mcs

databases as we can view a relational database DB as an mcs whose only context has:

- sets of ground first-order formulas as knowledge bases
 - sets of ground literals as belief sets
 - the natural closed-world semantics
 - DB as the knowledge base
- no bridge rules

relational databases

mcs

- databases as we can view a relational database DB as an mcs whose only context has:
 - sets of ground first-order formulas as knowledge bases
 - sets of ground literals as belief sets
 - the natural closed-world semantics.
 - DB as the knowledge base
 - no bridge rules
 - integrity constraints (in denial form) over DB can be $\sim \rightarrow$ written directly in our syntax

relational databases

mcs

- databases as we can view a relational database DB as an mcs whose only context has:
 - sets of ground first-order formulas as knowledge bases
 - sets of ground literals as belief sets
 - the natural closed-world semantics.
 - DB as the knowledge base
 - no bridge rules

integrity constraints (in denial form) over DB can be $\sim \rightarrow$ written directly in our syntax

correspondence theorem

DB satisfies a set η of integrity constraints iff the mcs induced by *DB* strongly/weakly satisfies the integrity constraints induced by η

$distributed \ databases$

- distributed databases store information in different nodes
- often there is duplication of data for efficiency/resilience

specify that both contexts agree on p

→ different consistency strategies can be expressed as repair preferences...

$deductive \ databases$

idea centralized database with several distinct views

"extensional" database does not contain rules, only data

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- "intensional" views do not contain data, only rules
- only the database can be changed

$deductive \ databases$

idea centralized database with several distinct views
"extensional" database does not contain rules, only data
"intensional" views do not contain data, only rules
only the database can be changed

as an mcs one context for the database, one for each view

- central database is one context (as before)
- each view is a context with empty knowledge base
- all inference is encoded as bridge rules in each view

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

→ also allows for views depending on views

deductive databases

compare

centralized database with several distinct views idea "extensional" database does not contain rules, only data "intensional" views do not contain data, only rules only the database can be changed one context for the database, one for each view as an mcs central database is one context (as before) each view is a context with empty knowledge base all inference is encoded as bridge rules in each view integrity constraints can... advantages ... talk about derived predicates ... express consistency among views repairing inconsistencies vs view-update problem

the open world case (i/ii)

ontologies

widely used in practice in knowledge representation

- thought of as universal intermediate language
- typically use description logics
- incomplete view of the world (open-world semantics)

the open world case (i/ii)

ontologies

widely used in practice in knowledge representation

- thought of as universal intermediate language
- typically use description logics
- incomplete view of the world (open-world semantics)

description logic

- essentially variants of first-order logic, with special syntax
- predicates are unary (*concepts*) or binary (*roles*)
- separate *terminology* (relationships) and *axioms* (instances)
- typically include higher-order constructors, i.e. transitive closure
- enjoy decidability and low complexity of reasoning

the open-world case (ii/ii)

extensions

- combination with rule-based reasoning
- controlled addition of closed-world semantics
- definition of integrity constraints (no follow-up)

the open-world case (ii/ii)

extensions

- combination with rule-based reasoning
- controlled addition of closed-world semantics
- definition of integrity constraints (no follow-up)

as an mcs an ontology can become a context

- knowledge bases are sets of well-formed formulas
- belief sets are *closed* sets of well-formed formulas
- acceptable beliefs are derivable consequences of the knowledge base

$integrity\ constraints\ in\ ontologies$

motik et al. '11

- integrity constraints over a single ontology
- terminological formulas, kept separate from the ontology

- seen as constraints on the knowledge state
 - not intended to infer new knowledge

$integrity\ constraints\ in\ ontologies$

motik et al. '11

integrity constraints over a single ontology terminological formulas, kept separate from the ontology seen as constraints on the knowledge state not intended to infer new knowledge

- fang et al. '11 integrity constraints among multiple ontologies
 datalog-style rules, kept separate from the ontologies
 specify consistency among different data sources
 - not intended to infer new knowledge

integrity constraints in ontologies

motik et al. '11 integrity constraints over a single ontology

- terminological formulas, kept separate from the ontology
- seen as constraints on the knowledge state
- not intended to infer new knowledge

partially captures the first scenario our proposal

- can use standard (partial) translations from description logic to logic programming
- can add a new context for faithfully expressing integrity constraints

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

but cannot talk about unnamed individuals

$integrity\ constraints\ in\ ontologies$

fang et al. '11

integrity constraints among multiple ontologies datalog-style rules, kept separate from the ontologies specify consistency among different data sources not intended to infer new knowledge

our proposal faithfully captures the second scenario

- our rules are similar to datalog syntax
- mcs make it easy to talk about several ontologies
- the proposal is also unable to talk about unnamed individuals

$integrity\ constraints\ in\ ontologies$

fang et al. '11

integrity constraints among multiple ontologies datalog-style rules, kept separate from the ontologies specify consistency among different data sources not intended to infer new knowledge

our proposal faithfully captures the second scenario

- our rules are similar to datalog syntax
- mcs make it easy to talk about several ontologies
- the proposal is also unable to talk about unnamed individuals
- it is not clear why we want integrity constraints over unnamed individuals...

problems how can we guarantee that the actions specified solve the problem?

- may depend on the actual knowledge base
- undecidable problem in general

our contribution

- integrity constraints in a general-purpose framework
- captures previous constructions as special cases
- clean separation between consistency and integrity

- express preferences between different models
- easily extended to include a notion of repair

thank you!
